

PROFILE VERIFICATION SYSTEM

ABSTRACT

A digital information verification (DIV) system (10) wherein a process controller (12) directs operation of a database manager (14) and a search engine (16) that access a personal base (20) and an entity base (22) containing information provided by individual-members (30) and entity-members (32), collectively users (34) of the DIV system (10). The users (34) access the DIV system (10) via user access devices (28), a communication unit (26), and an authentication processor (24) that determines the nature of each user (34) based on an ID number (44, 54) and password. The information provided by the users (34) is stored in personal records (40) and entity records (50), respectively stored in the personal base (20) and entity base (22), and can become verified information based upon comparison.
